

Building Style Transfer Tool from AI Models

OBJECTIVE

Programming is focused on building tools that could make artists' work more cohesive on both the front-end and backend of traditional pipelines

APPROACH

Evaluate both a reference image for style such as a painter or concept artist, and a second image to represent luminance value to transfer the style

AI MODELS / TECHNIQUE

- VGG 19
 - Extract semantic features from images at multiple levels of abstraction including edges and color, textures and patterns
 - Pre-trained AI model (no training required)
- AdaIN (Adaptive Instance Normalization)
 - Fast color and tone transfer
 - Require training (using MS-COCO Datasets)
- Tonal Mask Generation
 - Creates three smooth, overlapping masks based on image luminance
- Manual Mask Integration
 - User-defined regions for selective style application
- Claude AI for coding assistance

Auto-Generated Luminance Mask

Highlight

Midtone

Shadow

FINAL RESULT

Combine Three References

Highlight

Midtone

Shadow
